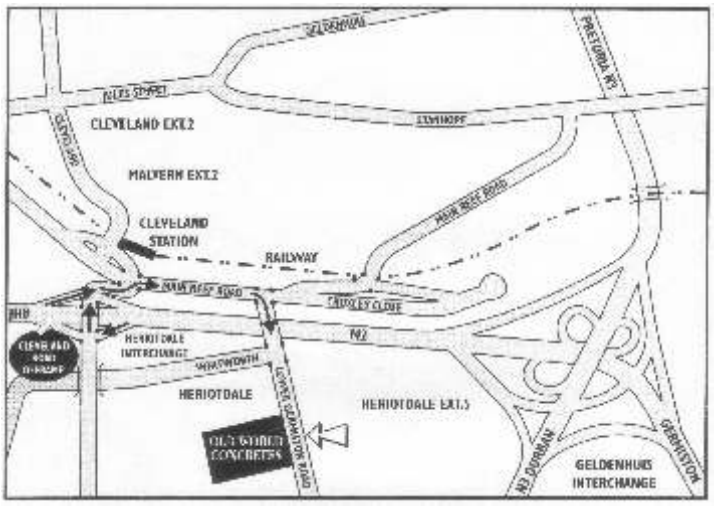
Google knows where we are!



Supply and Install

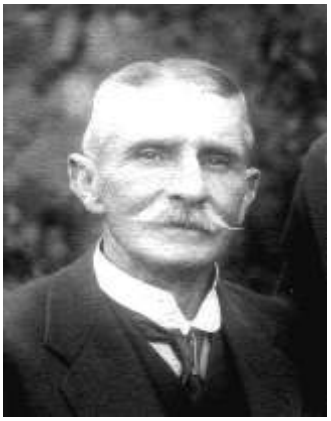
Ask us to quote on the installation of your selected Old World products. We undertake the installation of Columns, Balustrades, Mouldings, Fountains and other products illustrated in this catalogue.

Custom Made Items

We specialise in custom produced items where quantity or price warrants. Our moulding department is ready to discuss your project. We are suppliers to major projects - commercial, residential and industrial.

CAD with Old World Concretes

Most of the products listed in the “Architectural Precast Concrete” section of this catalog are available in AutoCAD format.
The drawings can be sent by email, or visit www.oldworld.co.za to request.



The “Old World” Heritage

Our Company was founded in 1919 by William Stephen Winter. Today the Company is proud to continue this tradition.

Section One: Your Garden.

Fountains

We no longer install fountains.
These fountains are supply only.
Purchasers of Supply Only fountains are assumed to have at least basic buildng skills.
Fountains will be dry assembled at our factory prior to supply for inspection. Our staff will be available to explain the construction sequence (at our yard only).
Tools for cutting and drilling will be necessary (tools not supplied).
A suitable imersion pump will also be required (see pump specification required for your fountain).

BALUSTRADING

• Balusters are manufactured from 25 Mpa reinforced concrete.
• Reinforcing extends from the bottom of the baluster by approx 100mm.
• Between 4 and 5 balusters are required per metre, depending on the height and thickness of the baluster and the overall visual symmetry of the end result. In all cases the relevant municipal requirements should be consulted with particular reference to safety.
• When a purpose made balustrade plinth is utilised, the position of each baluster is predetermined by holes cast into the plinth. Where no plinth is used the positions of the baluster holes must be set out and drilled manually.
• Balusters are fixed using a tile adhesive and riversand in equal parts. Sufficient adhesive should be utilised to fill the fixing hole and cover the area of the base of each baluster. Register each baluster to a line at the base, and a fishline strung at the top between the first and last balusters of a particular run. Plumb each baluster individually, using wood wedges where necessary.
• Allow to strengthen before installing the coping.
• Fix the coping using the same adhesive as for the balusters. Apply sufficient adhesive to cover the tops of all the balusters making contact, and the end face of the coping. Allow a joint of 5mm to 10mm. Use a fishline to ensure a neat result. Where applicable, set up two corners and then the fishline, working towards one end. One coping will require cutting and should be positioned one full length away from the end of a run. In some cases a very short cut length will be necessary. If this length is not fully supported by two balusters then it is to be discarded and two lengths must be cut, sharing out the short cut between them. • When installing long straight runs, or in critical areas, alternate lengths of coping should be drilled and fixed with a single steel pin and epoxy, into the top of a baluster.

DISCLAIMER

The above information is intended as a guide to the correct installation of precast concrete balustrading, and Old World Concretes (Pty) Ltd can in no way hold itself responsible for any installation not undertaken by its own representatives.

HOLLOW, NON STRUCTURAL FRC COLUMNS.
Certain columns are available as non structural, relatively lightweight hollow columns made of Fibre Reinforced Concrete. 15% premium on price. Caps and Bases solid.

NOTES REGARDING COLUMNS:
- Please order in good time as columns are made to order.
- Caps and Bases are supplied loose.
- Doric or Tuscan Caps/Bases are included in the per metre rate except where stated.
- Most columns are available as pilasters, less 10%.
- Maximum accuracy of manufacture is 20mm.
- If 1,5m or shorter, add 30% surcharge.
- Pleae quote overall height including caps and bases.

REINFORCING
- Columns are wet cast in steel reinforced 30mpa concrete.
- While we do not take responsibility for engineering design we are happy to discuss your requirements with your engineer, if necessary.
- Reinforcing cages consist of 4 bars ranging from Y8 to Y12 depending upon the shaft diameter and length. Stirrups are 3mm or 4mm wire at 200mm centers.
- We will cast in your specialised steel reinforcing if required.

FIXING OF FREE-STANDING COLUMNS
- The columns are to stand on properly prepared and designed concrete foundations. The design of the foundation would take into account the size and weight of the column itself, any anticipated external forces, and the nature of the soil conditions. Typically, a free-standing column foundation would have proportions of approx. 400 x 400 x 200 mm.
- Assuming adequate foundations have been prepared, the next step is to drill into the foundation and epoxy in one or more steel rods (dia say 10 mm). These rods are to be positioned so that they correspond with the hole in the centre of the precast base, and should be as near to the sides of the hole so as not to clash with the reinforcing of the shaft. Alternatively, these rods could be positioned at the time of casting the foundation.
- The precast base is then positioned over these rods and is bedded down using a strong mortar (say 2 parts crusher sand to 1 part cement by volume). Care is to be taken to ensure that the hole in the precast base is **not** filled.
- The bases are then left alone, at least until the next day, before positioning the column shafts.
- Immediately prior to placing the shafts, the hole in the precast base is filled with a strong concrete mix (say 2 parts small concrete stone, 2 parts crusher sand, 1.5 parts ordinary portland cement). The shaft is then set down on the precast base with the reinforcing bars of the shaft extending into the newly placed concrete. The reinforcing bars of the shaft should be checked for length prior to this, and trimmed if necessary, in order to prevent an annoying delay at a critical time. The shaft is to be plumbed and supported using wedges and timber planks, and everything should be left alone until the next day.
- Finally the cap is placed on top of the shaft and the hole in the cap is filled with the same mix as was the base. At this point, what ever may be required for the next stage of construction, should be cast into the cap (eg. bolts, wire ties, brackets, reinforcing rods, hoop irons, etc).
- All that remains is for the entire column to be finished off, pointing the joint between base/shaft and shaft/cap, and filling the scratches that occur during handling.
- The strength of the column installation should not be tested until the concrete has had time to gain strength.

DISCLAIMER
The above information is intended as a guide to the correct installation of precast concrete columns, and Old World Concretes CC can in no way hold itself responsible for any installation not undertaken by its own representatives.

Column Caps & Bases

NB. These Caps and Bases are not designed to "clip" onto or around an existing shaft.

All either position above/below the shaft at time of casting or require a 55mm recess to be cast or cut into the shaft for subsequent installation of the Cap/Base.
If you do not have a recess for the Cap/Base then the next bigger Cap/Base could be used but it is likely to look too big.
If you require the Cap/Base to fit around the shaft then please discuss your requirement with our sales staff before ordering.

See below for "clipon" Caps and Bases designed to be retrofitted to the Everite standard range of columns.

COLUMN CAPS and BASES		EACH Excl.	Vat 15%
