Piping Tools

Fusion Machine

- This is what makes the process possible and it is imperative that the tools are well maintained and looked after.
- Use the correct protective gear and exercise caution when using a fusion machine
- They reach very high temperatures, which can cause injury.
- Never leave a fusion machine that is switched on unattended.
- Please read the operating instructions from the manufacturer to ensure you understand how to operate the machine.

Saddle Drill

- The saddle drill is only to be used to drill into Atlas PP-R pipe to install a saddle.
- Always drill into the middle of the pipe. Clean any shavings off the pipe after drilling.

Welding Sockets

- This is one of the most important components in the fusion process.
- Each socket is able to do between 200 – 400 joints depending on how they are maintained.
- The sockets must be tightly fixed to the fusion machine to ensure even heat distribution and prevent damage.
- The coating on the sockets is Teflon and if this is damaged in any way then the socket must be replaced immediately.
- The sockets must only be tightened with the correct size allen key and no other tool.
- If any pipe material remains on the socket after completing a join, clean the socket immediately with a dry clean cloth to ensure a better lifespan of the socket.

Pipe Cutter

- Ensure that the blade is secure to prevent uneven cuts.
- If the pipe is not cut squarely and cleanly then replace your cutter.
- Use a good quality cutter.
